

FEED WATER MODULE

Description:

The module is used for preparing the feed water supply of steam boiler plants

The module consists of supplying reservoir with degassing and measurement of regulatory elements necessary for normal operation:

- Water level indicator
- The level regulator
- Group with electromagnetic valve for CTWater
- Group for pressure regulating
- Group for temperature regulating
- Supporting armature: stop valves, disc check valves, automatic air vent, vacuum breaker, safety valve, thermometer ...

Work methods:

The chemical treated water, preheated to 90 ° C, together with a return condenser, was heated in a air separator to the boiling point; gases at the stand, leaving the atmosphere.
